Problem statement:

To analyze retail sales data using Excel and Power BI to identify sales trends, top-performing products, and customer behavior.

Tools Used:

- Microsoft Excel: Data Cleaning, Transformation, and Validation
- Power BI: Data Modeling, DAX Calculations, and Dashboard Creation

Dataset Description

Sheets Used:

- Customers
- Products
- Stores
- Sales

Columns Used:

- CustomerID, ProductID, StoreID, Quantity, SaleDate, TotalAmount, Category, State

Data Cleaning & Transformation (Excel)

- Performed data preparation and cleaning using Excel before importing into Power BI:
- Removed missing, duplicate, and inconsistent entries
- standardized date and numeric formats (e.g., SaleDate, Quantity)
- Used Excel formulas like TRIM, IFERROR, and VLOOKUP for corrections
- Merged multiple sheets (Customers, Products, Stores, Sales) for integration
- Ensured consistency between CustomerID, ProductID, and StoreID
- Added calculated columns (Total Amount = Quantity × Unit Price)
- Result: A clean and transformed dataset ready for Power BI modeling.

Data Modeling (Power BI)

Schema Type: Star Schema

Relationships:

- Sales → Customers (CustomerID)
- Sales → Products (ProductID)
- Sales → Stores (StoreID)

Fact Table: Sales

- Dimension Tables: Customers, Products, Stores, Date
- Note: Cleaned Excel data was imported into Power BI for relational modeling.

DAX Measures Created

- Total Sales = SUM(Sales[TotalAmount])
- Total Quantity = SUM(Sales[Quantity])
- Profit = SUMX(Sales, Sales[TotalAmount] * 0.2)

Dashboard Design

Visuals Used:

- KPI Cards: Total Sales, Quantity, Customers, stores, sales Profit

- Line Chart: Sales Trend over Time

- Bar Chart: Sales by Category & Sub Category

- Donut Chart: Sales by Gender

- Map: Sales by State

- Line Chart: Stores sale by Month

- Scatter Chart – Unit Price vs Quantity

Insights & Findings

- The Electronics category contributed the highest sales.
- Kerala and Karnataka had top-performing stores.
- Meghalaya and Himachal Pradesh had low Performance
- Male customers (Age 40–50) were the most active buyers.

Analytical Approach – Descriptive, Diagnostic, Predictive & Prescriptive

- **Descriptive Analysis:**

The cleaned dataset revealed that overall sales performance has been declining gradually over time. Period-by-period comparisons show consistently low sales figures.

- **Diagnostic Analysis:**

The analysis identified that only a few stores are performing well, while several others have low sales — indicating uneven performance across locations.

- **Predictive Analysis:**

If this declining trend continues, the company is likely to face a reduction in overall revenue and potential financial losses in the future.

- **Prescriptive Analysis:**

To overcome this issue, the company should activate underperforming stores by introducing offers and discounts, motivating sales employees through incentives, and increasing marketing efforts and advertisements to boost sales growth.

Conclusion:

- Excel was used effectively for initial data cleaning and transformation.
- Power BI visualized sales and customer patterns clearly.
- Identified profitable categories and top-performing stores.
- Insights can help optimize inventory and marketing decisions.
